

Distribution of sequence types by serotype and source in Bakerganj and Mathbaria. For each sequence type, the source is indicated by a C for clinical or an E for environmental, the number of isolates follows after n=, and the month(s) when it was isolated. The arrows indicate sequence types found at both locales, while the barbells indicate sequence types found in both clinical and environmental samples within a locale.

**C**: clinical isolate; **E**: environmental isolate

 : indicates genotypes are found in both clinical and environmental isolates

 : indicates genotypes found in both Bakerganj and Mathbaria
