

## Emerging Infections in Asia

Yichen Lu, Myron Essex,  
Bryan Roberts, editors

Springer, New York, NY, USA, 2008  
ISBN: 978-0-387-75721-6  
Pages: 250; Price: US \$89.95

Emerging Infections in Asia comprises a selection of scientific and historical review chapters on a variety of infectious diseases and includes contributors from diverse locations ranging from Saudi Arabia to Australia. The book arose from the editors' experience with the emerging infections described and from their professional associations with the other contributors. The book is divided into 3 disease-specific sections that focus on avian influenza, severe acute respiratory syndrome (SARS), and HIV/AIDS, respectively; a fourth section contains short reviews of other infections. Because of the relatively small size of the book for such a broad topic (250 pages), each section covers only a few specific topics for each selected disease.

The book contains some well-written reviews and valuable narrative histories that are important to document (e.g., the 2003 SARS outbreaks in Singapore and Taiwan). The chapters on SARS in animals and emerging paramyxoviruses are particularly interesting, and the book includes topics (e.g., *Escherichia coli* and *Staphylococcus aureus*) that are often overshadowed by more glamorous emerging infections. However, it is disappointing in that the first 2 chapters contradict one another on the occurrence of person-to-person transmission of influenza virus A (H5N1), and the chapter on SARS in China could have been improved with more rigorous editing. Most chapters appear to have been written around 2006, and although they provide good snapshots of the state of knowledge at that time, readers will need to look elsewhere for more recent developments.

Emerging Infections in Asia also misses an opportunity to pull together the diverse topics and experiences discussed to provide new insights into the emergence of infectious diseases and into responses to the constantly shifting challenge of emerging infections. Recognizing this drawback, the editors say in their preface, "We hope that our book can help readers make their own conclusions and ask more questions." Approached in this context, the book provides an account of the diversity and challenges of emerging infectious diseases in Asia and some informative historical reviews that will be of interest to students exploring this fascinating topic.

## War and Disease: Biomedical Research on Malaria in the Twentieth Century

Leo B. Slater

Rutgers University Press,  
Piscataway, NJ, USA, 2009  
ISBN: 978-0-8135-4438-0  
Pages: 272, Price US \$45.95

War and Disease is a fascinating historical account of the discovery of drugs effective against malaria, one of the great scourges of humankind.

The author, Leo B. Slater, makes good use of his expertise as a historian of biomedical science and technology. He provides a meticulous reconstruction of the manner in which the scientific community, in the midst of World War II, established an antimalarial program, which was to biomedical research what the Manhattan Project was to the physical sciences. At a time when industrialized nations are involved in the effort to find solutions to the ongoing global health catastrophe that malaria is today, this volume is a timely and valuable contribution.

Malaria's effects have long been at the center of colonial expansion and war. The disease became a focus of research in the late nineteenth century. France and Great Britain had expanded their colonies into areas of the world where malaria was the most severe and debilitating of the parasitic tropical diseases—a factor that limited the colonial governments' exploitation of natural resources. Malariologic research thrived in these countries and in Italy, where the disease was not a colonial problem but an endemic scourge and overwhelming obstacle to development, just as it is in many developing countries today. From 1880 through 1898 research carried out by such prominent scientists as Charles-Louis-Alphonse Laveran, Ronald Ross, Angelo Celli, Ettore Marchiafava, and Giovanni Battista Grassi led to the discovery of the malaria transmission cycle. The neurologist, Camillo Golgi, who shared the 1906 Nobel Prize for his work on the structure of the nervous system, studied the reproductive cycle of the parasite (*Plasmodium* spp.) and elucidated the synchronicity between the symptoms of recurrent chills and fever and the rupture and release of merozoites into the blood. These findings offered an explanation for the effectiveness of treatment with quinine, which had been used empirically as a generic febrifuge since the 17th century. The alkaloid remained the only effective
