Technical Appendix

Assessing the Costs and Benefits of an Oral Vaccine for Raccoon Rabies: A Possible Model

Martin I. Meltzer

Centers for Disease Control and Prevention, Atlanta, Georgia, USA

A cost-benefit analysis uses the following formula (15):
Threshold costs were calculated by altering vaccine cost so that benefits minus cost, when discounted and summed over time, had an NPV of $0.

\[
Net \text{ Present Value (NPV)} = \sum_{t=0}^{t=n} \frac{(\text{Benefits-Costs})_t}{(1+r)^t}
\]

where:

- \( t = \) year, from \( t = 0, \ldots, n \)
- \( r = \) discount rate.
