Worker Health and Safety Practices in Research Facilities Using Nonhuman Primates, North America

To the Editor: Since 1975, federal quarantine regulations (1) have restricted nonhuman primate importation to scientific, educational, or exhibition purposes to limit risks for disease introduction (1,2). Infectious diseases resulting from importation of nonhuman primates need to be prevented to ensure that colonies of these animals are available for research and to protect persons working with them from exposure to established and emerging zoonotic diseases (2,3).

Most imported nonhuman primates are bred for research and undergo standard screening and conditioning before shipment, which substantially reduce importation-associated health risks (4). However, many zoonotic agents can be difficult to exclude from even meticulously controlled breeding facilities (3,5). Nonhuman primates are commonly imported from regions with a high prevalence of potentially zoonotic diseases, such as tuberculosis and melioidosis, in humans and animals. Diagnosing tuberculosis in nonhuman primates can be difficult; inadvertent colony and human exposures can occur through undiagnosed cases (6). Similarly, *Burkholderia pseudomallei*, the causative agent of melioidosis, can be carried asymptomatically for extended periods before illness onset, posing a persistent exposure risk for persons working with imported nonhuman primates from regions to which melioidosis is endemic (7). Finally, nonhuman primates are host to potentially zoonotic viruses, such as simian foamy virus, which has unknown pathogenic potential in infected persons (8), and *Macacine herpesvirus 1*, which causes severe, often fatal, neurologic disease in humans exposed to macaques with asymptomatic infection (9).

Quarantine and testing of imported nonhuman primates, rigorous hygiene at research facilities, and strict personal protection equipment (PPE) standards are important to protect the health of nonhuman primate colonies and persons working with the animals (4). Importers must register with the Centers for Disease Control and Prevention (CDC) and implement disease control measures, including a 31-day quarantine for newly arrived animals (1). Specific PPE is mandated for quarantine facility staff, but individual facilities determine PPE standards after the animals are released from CDC-mandated quarantine (4).

To better understand occupational health and safety practices at facilities housing nonhuman primates, in December 2012, the Association of Primate Veterinarians, with technical support from CDC, surveyed primate veterinarians in North America about animal handling practices and PPE standards at their institutions. The Association of Primate Veterinarians received completed surveys and removed identifying information before providing data to CDC for analysis.

CDC and the University of Guelph (Guelph, ON, Canada) determined that the survey did not qualify as human subjects research. Information collected applied to the institution, not the individual respondent. Respondents were informed that participation was voluntary and anonymous, refusal carried no repercussions, and results would be presented in aggregate.

Of 149 facilities, 7 (5%) indicated they were not currently housing nonhuman primates, and 26 (17%) provided completed surveys. Most responding facilities were university or private/contract research facilities (16 [62%] and 5 [19%] facilities, respectively). Most (18 [69%]) facilities maintained ≤500 nonhuman primates, primarily rhesus or cynomolgus macaques. Nineteen (73%) facilities acquired imported nonhuman primates during 2010–2012. During this period, 47,876 nonhuman primates were imported, of which 90% were cynomolgus macaques. Fewer nonhuman primates were acquired from domestic sources (1,877 animals; see also [10]).

In a free-text field, we asked about quarantine and testing policies for newly acquired nonhuman primates. Most facilities reported applying standard health requirements to newly acquired animals, regardless of source, and requiring additional quarantine periods before moving new animals into the facility population or assigning them to a study.

The number of staff working near nonhuman primates differed among facilities. Ten (38%) facilities reported that ≥30 staff members handle or work in close proximity to nonhuman primates for cleaning or observation each day (Table). All facilities required PPE for routine handling of animals, including use of surgical masks or N95 respirators; goggles, safety glasses, or full-face shields; specialized clothing (e.g., laboratory coat, scrubs, or coveralls); gloves; and either shoe covers, reusable boots, or facility-designated shoes (Table).

Twenty-one (81%) facilities reported routinely handling conscious nonhuman primates by using specialized safety equipment (e.g., pole and collar or restraint chair). Four (15%) facilities reported manually capturing nonhuman primates for cleaning or observation each day (Table). All facilities required PPE for performing postmortem examinations. Five facilities specified that complete necropsies were performed only on animals found dead or euthanized because of illness or injury; for animals euthanized at study completion, targeted tissue specimens were collected to fulfill research objectives (Table).

These results suggest that responding facilities generally maintained high standards for health and safety and

**Required personal protection equipment**
- Respiratory protection used
  - Surgical mask: 21 (81)
  - N95 respirator: 8 (31)
  - Powered air-purifying respirator: 4 (15)
- Eye protection
  - Goggles/safety glasses: 19 (73)
  - Full face shield: 24 (92)
- Protective clothing
  - Laboratory coat/scrubs: 17 (65)
  - Reusable coveralls: 17 (65)
  - Disposable coveralls: 15 (58)
  - Head covering/cap/bonnet†: 8 (31)
  - Extra gown layer/arm covers†: 5 (19)
- Gloves
  - Latex or nitrile gloves: 26 (100)
  - Double gloves‡: 14 (53)
  - Leather gloves‡: 2 (8)
- Footwear
  - Shoe covers: 24 (92)
  - Reusable boots: 10 (38)
  - Shoes designated for use in facility only†: 6 (23)

**Handling of animals**
- Manually capture conscious animals ("hand-catch")‡: 4 (15)
- Handle conscious animals with special equipment (e.g., pole and collar, chair): 21 (81)
- Conduct tuberculin skin tests on conscious animals: 2 (8)
- Routinely conduct necropsy on nonhuman primates that die: 26 (100)

---

*Because respondents could select >1 option, percentages will not total 100% within each personal protection equipment category.
†This answer choice was not one provided in the answer options but was provided in the associated free-text field for "other." The number provided reflects the number of respondents who volunteered this answer under "other."†
‡One respondent skipped this question. Percentages calculated with 25 facilities as the denominator.
§Five respondents provided a written caveat that all animals that die spontaneously or are euthanized specifically because of health concerns routinely undergo necropsy but noted that animals euthanized at study completion often undergo study-specific tissue collection that might not include a complete necropsy.
