and commercial kits (3). Future availability of promising
ultra-sensitive tests (e.g., PCR and antigenic tests) may
overcome the limitations associated with conventional
microscopy and serologic testing for low-parasite load
schistosomiasis.

As stated in our manuscript, we cannot exclude the pos-
sibility that our case definition generated false-positives; the
potential limitations of our findings have already been dis-
cussed (4). Furthermore, we were cautious with our inter-
pretation of the serologic test results and, therefore, claimed
only 2 confirmed cases (4), 1 on the basis of egg detection
and the other on positive serologic test results by using 2
different methods. We believe, on the basis of our findings
(4) and in accordance with the European Centre for Disease
Control experts (5), that the possibility of transmission in the
Cavu River during the summer of 2014 cannot be excluded.
We also want to reiterate the possibility of transmission in
other rivers in Corsica, including the Solenzara, Osu, and
Tarcu rivers, where Bulinus snails, which can serve as in-
termediate hosts for Schistosoma haematobium, were found
during a malacological survey in 2014 (5).
