Acknowledgments
We thank Fernando Gil and Aldo López for the authorization for the development of the research in PVWR and VWRCA, respectively. Thanks are due to the biologist Christian Carazas and the engineer José Junco for help in some sampling of snails; to Rosa Martínez for the use of the laboratory at Universidad Nacional Mayor de San Marcos, Peru; and to Airton Lobo for technical support. We are grateful to Sara Vanessa Brant for constructive suggestions in the earlier version of this work.

This project was supported financially by Coordenação de Aperfeiçoamento de Pessoal de Nível Superior (CAPES) (process no. 23038.005297/2011-39) and Conselho Nacional de Desenvolvimento Científico e Tecnológico (CNPq), Brazil (scholarship to E.A.P.M. and L.F.V.F.).

About the Author
Mr. Pulido-Murillo is a PhD student from Peru working in the Universidade Federal de Minas Gerais, Brazil. His research interests focus on morphological and molecular study of zoonotic helminths.

To the Editor: I read with great interest the report by Lefebvre et al. about a Neisseria gonorrhoeae isolate identified in Canada demonstrating a ceftriaxone MIC of 1 mg/L (1). The authors note: “As of October 15, 2017, only 5 ceftriaxone-resistant Neisseria gonorrhoeae isolates had been reported worldwide (MIC range 0.5–2 mg/L).” The authors cite published reports from Spain, Japan, Australia, and France.

I would like to clarify that additional N. gonorrhoeae isolates have been identified with ceftriaxone MICs ≥0.5 mg/L. Since 1987, as part of the Gonococcal Isolate Surveillance Project, the Centers for Disease Control and Prevention has been testing N. gonorrhoeae isolates for ceftriaxone susceptibility. During 1987–2016, the Centers for Disease Control and Prevention identified and reported 5 isolates with ceftriaxone MICs of 0.5 mg/L in the United States. These isolates were found in San Diego, California (1987); Cincinnati, Ohio (1992 and 1993); Philadelphia, Pennsylvania (1997); and most recently, Oklahoma City, Oklahoma (2012) (2). Therefore, although the number of N. gonorrhoeae isolates with ceftriaxone MICs ≥0.5 mg/L identified globally to date has been small, these Gonococcal Isolate Surveillance Project findings should be acknowledged. Continued and enhanced global surveillance of gonococcal isolates for antimicrobial susceptibility testing is imperative.
