# Cost of Acute and Sequelae Care for Japanese Encephalitis Patients, Bangladesh, 2011–2021

## Appendix

### Sample size formula

We use the standard sample size formula for estimating a population mean (*I*) to calculate the target sample size:

$$n = \text{ceiling} \left[ \left( \frac{\text{precision}^2}{CV^2 \times Z_{1-\alpha/2}^2} + \frac{1}{N_0} \right)^{-1} \right]$$

Setting precision at  $\pm 10\%$  of the mean cost, coefficient of variation of 0.5 and considering the estimated 195 annual JE patients per year since 2011, and Bangladesh case fatality rate of 10% (2,3), we estimated total sample size of 229 with 64 patients for acute group, 75 patients for initial sequelae group, and 90 patients for long-term sequelae group. Due to the small number of JE patients identified during the COVID-19 pandemic (between November 2019 and December 2021), we administered both acute and initial sequelae questionnaires to enrolled participants to achieve the target sample size.
