# Influence of Sex and Sex-Based Disparities on Prevalent Tuberculosis, Vietnam, 20172018 

## Appendix

| Category | Coefficient | 95\% CI | $P$ |
| :---: | :---: | :---: | :---: |
| Clinical symptoms |  |  |  |
| Weight loss | 1.13 | 0.63-1.62 | <0.001 |
| Fever | 1.28 | 0.71-1.86 | <0.001 |
| Night sweats | 1.98 | 0.74-3.22 | 0.002 |
| Cough | 1 |  |  |
| Access to healthcare |  |  |  |
| First healthcare facility visited | 2.30 | 0.8-3.8 | 0.002 |
| Health insurance status | 0.46 | 0.17-0.74 | 0.002 |
| HIV status | 0.87 | 0.47-1.26 | <0.001 |
| Chest x-ray taken in the past | 0.98 | 0.53-1.42 | <0.001 |
| Distance from home to the nearest hospital | 1 |  |  |
| Behavioral and environmental risks |  |  |  |
| Work indoor | 0.50 | 0.30-0.70 | <0.001 |
| Miner | -0.19 | -1.07-0.70 | 0.681 |
| Contacted with TB patients | 0.55 | 0.29-0.81 | <0.001 |
| Diabetes | 0.33 | -0.10-0.69 | 0.067 |
| Excessive drinking | 0.86 | 0.34-1.36 | 0.001 |
| Passive smoking | 3.26 | 1.20-5.35 | 0.002 |
| Amount of pack-year | -0.20 | -0.52-0.12 | 0.221 |
| Smoking | 1 |  |  |
| Socio-economic status |  |  |  |
| Household assets | 0.45 | 0.23-0.68 | <0.001 |
| Occupation | 0.53 | 0.27-0.79 | <0.001 |
| Marital status | 0.07 | -0.13-0.47 | 0.104 |
| Educational level | 1 |  |  |
| Confirmatory Factor Analysis results, where each measures of the respective domain. The stronges Clinical symptoms: Weight loss: Yes - No; Fever: Access to healthcare: First healthcare facility visite status: HIV negative - HIV unknown; Chest x-ray traveling) - Far (more than 15 min of traveling). Behavioral and environmental risks: Work indoor: home - Other places - Unknown.; Diabetes: Yes drinks for women in the last 30 d ) - No; Passive s pack-year: First tertile (<10 pack-years) - Second Current smoker. <br> Socio-economic status: Household assets: Rich employed - Unemployed; Marital status: Single (in Undergraduate/Postgraduate - Highschool - Second | a latent varia st measure of Cough: Yesctor facility; He from home to <br> - No; Contac ng at least one smoking in y rtile (>20 pack <br> officials - Non parated, and schooling. | rise to the obs <br> status: Insur hospital: Near <br> patients: No con drinking at leas ent in the last 30 king: Non-smo <br> al organizations arried; Educati | lying <br> rance; HIV 5 min of <br> work - At r men and 4 mount of oker -Self- |

Appendix Table 2. Sensitivity analysis 1: Structural Equation Model full estimation results of the relationships between sex, behavioral and environmental risks, access to healthcare, socioeconomic status, and Xpert(+) prevalent TB.

| OUTCOME: | Xpert (+) prevalent TB |  |  | Access to care |  |  | Behavioral and environmental risks |  |  | Socioeconomic status |  |  |

| *Adjusted odds ratio (aOR). TI Variable was not included as predictor for the respective outcome. Sex, age, area, and region were not an outcome in this Structural Equation Model. Model results were weighted using sampling and lost to follow up weights. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Page 4 of 6

Appendix Figure 1. Structural equation model with pathway analysis between tuberculosis and other domains among women. Statistically significant associations are indicated by the solid arrows and statistically insignificant associations by the dashed arrows. For the significant associations, the arrow thickness corresponds to the effect size. Each outcome was adjusted for age, area, and region. Model results were weighted using sampling and lost-to-follow-up weights. Bootstrapped area under the curve ( 1,000 replications) was 0.83 ( $95 \% \mathrm{CI} 0.80-0.86$ ).

$\longrightarrow$ Statistically significant ( $p<0.05$ )
----> Tested, not statistically significant
Appendix Figure 2. Structure equation model with pathway analysis between tuberculosis and other domains among men. Statistically significant associations are indicated by the solid arrows and statistically insignificant associations by the dashed arrows. For the significant associations, the arrow thickness corresponds to the effect size. Each outcome was adjusted for age, area, and region. Model results were weighted using sampling and lost-to-follow-up weights. Bootstrapped area under the curve (1,000 replications) was 0.89 ( $95 \% \mathrm{CI} 0.87-0.91$ ).
