

Syphilitic Aortitis with Concomitant Neurosyphilis in Asymptomatic Patient

Appendix

Appendix Figure. Contrast-enhanced computed tomography of the ascending aorta in an 89-year-old patient with syphilitic aortitis and concomitant neurosyphilis. Axial images at the level of the A) sinotubular junction and B) the aortic arch. White arrows indicate a diffuse circumferential enhancing soft tissue rim

around the aorta. C) Coronal and D) sagittal images demonstrate extent of involvement. White arrows indicate diffuse involvement from the aortic sinotubular junction to the proximal aspect of the arch vessels.
