# Life-Threatening SARS-CoV-2–Associated Encephalopathy and Multiorgan Failure in Children, Asia and Oceania, 2022–2024

## Appendix

**Appendix Figure.** The relationship between serum levels of indicated cytokine and chemokine and the interval between the neurologic onset and blood collection. Samples collected more than 72 hours after neurologic onset were excluded. Fitting curves were generated using logarithmic regression in Microsoft Excel. Cytokine and chemokine levels tended to be higher when samples were collected earlier, and the peak occurred within 24 hours after neurological onset. The values for each cytokine/chemokine are presented on a logarithmic scale.
